Bioinformatics 1 (C000178)

Course size (nominal values; actual values may depend on programme)

Credits 5.0	**Study time** 150 h	**Contact hrs**	55.0h	

Course offerings and teaching methods in academic year 2022-2023

A (semester 1)	English	Incheon	lecture	23.0h
			seminar: practical PC room classes	32.0h

Lecturers in academic year 2022-2023

De Neve, Wesley	KR01	lecturer-in-charge
Shim, Hyunjin	KR01	co-lecturer

Offered in the following programmes in 2022-2023	**crdts**	**offering**
Bachelor of Science in Molecular Biotechnology	5	A

Teaching languages

English

Keywords

Algorithmic design, Algorithms, Bioinformatics, Creative problem solving, Complexity analysis, Datastructures, Programming, Python

Position of the course

The field of bioinformatics was born after biologists discovered how to sequence (digitize) DNA, raising the need for mathematical and computational techniques to decipher the language of DNA, RNA, and proteins. As a result, bioinformatics has become an important part of modern biology, often facilitating new insights and new (data-driven) approaches, driving forward biological research and development efforts.

Primarily taking an algorithmic point-of-view, this course aims at introducing students to the design, implementation, and analysis of standard problem-solving techniques in the field of bioinformatics, including exhaustive search algorithms, recursive algorithms, divide-and-conquer algorithms, greedy algorithms, graph algorithms, dynamic programming algorithms, randomized algorithms, and machine-learning algorithms. These algorithms and related datastructures (e.g., lists, tuples, sets, dictionaries, graphs, hash tables, and trees) are studied in the context of problems like pattern finding, genome rearrangements, genome assembly, sequence alignment and comparison, regulatory motif finding, and genome annotation.

Contents

Based on Capita Selecta from the course handbook used, this course deals with the following computational topics, making use of pseudocode and the Python programming language:
• algorithms and complexity, including asymptotic notation (Chapter 1, Appendix);
• exhaustive search algorithms and pruning (Chapter 1, Chapter 4);
• recursive and divide-and-conquer algorithms (Chapter 1, Chapter 5, Appendix);
• greedy algorithms (Chapter 6);
• graph algorithms (Chapter 3);
• dynamic programming algorithms (Chapter 5);
• randomized and genetic algorithms (Chapter 2); and
• machine learning algorithms (slides).
The above algorithms are studied in the context of the following problems:
• pattern finding in biological sequences;
• genome rearrangements;
• genome assembly;

- sequence alignment and comparison;
- regulatory motif finding; and
- genome annotation.

The theory is brought into practice through six series of mostly computer-based exercises.

Initial competences

An understanding of basic probability theory and the behaviour of common functions studied in calculus (e.g., linear functions, logarithmic functions, exponential functions).

Prior experience in at least one high-level programming language (e.g., Python).

Informatics (0000096)

Final competences

1 Understand the biological motivation of common bioinformatics problems, as well as their mathematical and computational abstraction.
2 Be familiar with the standard algorithms and datastructures used in bioinformatics.
3 Design and implement algorithms for new bioinformatics problems using standard algorithmic techniques.
4 Compare the effectiveness and time/memory efficiency of different algorithmic techniques in solving different bioinformatics problems.

Conditions for credit contract

Access to this course unit via a credit contract is determined after successful competences assessment

Conditions for exam contract

This course unit cannot be taken via an exam contract

Teaching methods

Lecture, Seminar: practical pc room classes

Learning materials and price

Handbook: Philip Compeau, Pavel A. Pevzner (2018). Bioinformatics Algorithms: An Active Learning Approach. Third edition (2018). Active Learning Publishers, ISBN-13: 978-0990374633. About $100.

Slides shown during the lectures will be made available on Ufora (in English), together with additional learning materials (e.g., knowledge video clips, background information, links to relevant websites, and previously used exams).

Free digital tools like Anaconda and PyCharm for writing and debugging source code.

The free Dodona online platform for automated verification of the correctness of solutions written in Python.

Students are required to have a personal laptop for use in this course.

Course content-related study coaching

The theory lectures touch upon the biological motivation of common bioinformatics problems, as well as their mathematical and computational abstraction.

During the weekly supervised hands-on sessions, students themselves learn how to tackle computational challenges in the field of bioinformatics by solving a series of mandatory computer exercises, mostly on an individual basis. These exercises aim at bringing the theory into practice.

Example examinations of previous years are made available on Ufora near the end of the teaching activities.

Information about the calculation of the different evaluation marks is communicated during the theory lectures at the beginning and near the end of the first-term teaching activities.

Announcements on Ufora are used for counselling, giving feedback, and providing background information.

Through individual appointments scheduled via email, the lecturers and the teaching assistants are available for answering questions about the course in general (grading, examination), the theory, and the exercises.

Assessment moments

end-of-term and continuous assessment

Examination methods in case of periodic assessment during the first examination period

Skills test, Written examination with multiple choice questions, Written examination with open questions

Examination methods in case of periodic assessment during the second examination period

Skills test, Written examination with multiple choice questions, Written examination with open questions

Examination methods in case of permanent assessment

Assignment

Possibilities of retake in case of permanent assessment

examination during the second examination period is not possible

Calculation of the examination mark

For the **first-term examination period**, the continuous assessment (hands-on sessions; non-periodic evaluation; permanent evaluation) accounts for 30% of the final examination mark and the end-of-term assessment (examination; periodic evaluation) accounts for 70% of the final examination mark. To qualify for passing, both the mark of the continuous assessment and the mark of the end-of-term assessment should be higher than or equal to 8/20 (40%). If that is not the case, the final examination mark will be subject to an upper limit of 7/20. Note that the end-of-term assessment consists of a written closed-book part, accounting for 50% of the mark, and a computer-based open-book part, accounting for 50% of the mark.

The continuous assessment cannot be retaken during the **resit examination period**. Therefore, the examination mark for the resit examination period is calculated twice. For the first calculation, the mark of the continuous assessment, as obtained for the first-term examination period, accounts for 30% of the examination mark and the mark of the resit assessment, as obtained during the resit examination period, accounts for the remaining 70% of the examination mark. For the second calculation, the examination mark is equal to the mark of the resit assessment, as obtained during the resit examination period (that is, the mark of the continuous assessment, as obtained for the first-term examination period, is ignored). The final examination mark for the resit examination period is then equal to the maximum of the above two calculations. Note that the resit assessment consists of a written closed-book part, accounting for 50% of the mark, and a computer-based open-book part, also accounting for 50% of the mark.

Students who eschew period aligned and/or non-period aligned evaluations for this course unit may be failed by the examiner.
