

## Informatics (0000096)

**Course size** *(nominal values; actual values may depend on programme)*

**Credits** 10.0

**Study time** 300 h

**Course offerings and teaching methods in academic year 2024-2025**

A (Year)	English	Incheon	seminar lecture
----------	---------	---------	--------------------

**Lecturers in academic year 2024-2025**

De Neve, Wesley	KR01	lecturer-in-charge
-----------------	------	--------------------

**Offered in the following programmes in 2024-2025**

	crdts	offering
<a href="#">Bachelor of Science in Environmental Technology</a>	10	A
<a href="#">Bachelor of Science in Food Technology</a>	10	A
<a href="#">Bachelor of Science in Molecular Biotechnology</a>	10	A
<a href="#">Joint Section Bachelor of Science in Environmental Technology, Food Technology and Molecular Biotechnology</a>	10	A

**Teaching languages**

English

**Keywords**

Command line, Computational thinking, Creative problem solving, Programming, Python, SQL, UNIX

**Position of the course**

Scientists and engineers are regularly confronted with time-consuming and repetitive tasks when having to process and analyse data, namely collecting information from websites, converting files from one format to another, and analysing, summarizing, and visualizing the information obtained. Moreover, given that data are often arriving at an exponential rate, present-day scientists and engineers are required to be able to automate the aforementioned tasks, in order to speed up their daily job routines.

This course teaches students how to describe time-consuming and repetitive tasks in such a way that they can be performed automatically by a (network-based) computer system. To that end, students will acquire the necessary skills for computer-based creative problem solving through learning to think and work in (1) Python, a popular programming language, and (2) UNIX, the workhorse operating system of science and engineering. The computer problems that need to be solved are taken from different scientific disciplines, including mathematics, biology, chemistry, physics, and computer science.

To take part in this course, students do not need to have any prior programming experience. However, to be successful for this course, students need to have an aptitude for mathematics and logic. In addition, given that this course follows a '*learning by doing*' and a '*learning from mistakes*' approach, students need to have a willingness to solve computer problems on a regular basis.

**Contents**

Programming is the process of designing, writing, testing, debugging, and maintaining the source code of computer programs. This requires knowledge of the syntax and the semantics of a programming language, as well as the ability to write programs in that language. Additionally, and maybe most importantly, when writing computer programs, one must learn how to think like a programmer. This process of computational thinking (that is, learning how to solve problems by programming) is a common theme throughout the whole course.

In this course, students learn how to make use of the Python programming language to solve a plethora of problems. To that end, attention is paid to:

- basic components: instructions, variables, data types, and operators;
- control structures: conditional statements, repetitive statements, and functions;
- data structures: strings, lists, tuples, dictionaries, sets, modules, and files;
- text files: reading, processing, and writing data; and
- object-oriented programming: objects, classes, attributes, methods, encapsulation, polymorphism, and inheritance.

Furthermore, in this course, students learn how to make use of UNIX-based tools to automate repetitive or complex tasks. To that end, attention is paid to:

- the principles of UNIX-based operating systems;
- consulting technical documentation;
- running a remote interactive session (VPN, SSH);
- file systems;
- interactive command line usage;
- text file formats (HTML, XML, CSV, FASTA);
- filters, redirection, and pipes;
- regular expressions (regex);
- interactive text editing (e.g., through vim);
- automated text editing using edit commands; and
- the basics of shell scripting.

Finally, in this course, students learn how to make use of the Structured Query Language (SQL) to communicate with a relational database.

#### **Initial competences**

An aptitude for mathematics and logic.

An interest in solving (scientific) problems.

Some basic computer knowledge is advantageous (prior programming skills are not required).

#### **Final competences**

- 1 Translate a task described in natural language into a program written in Python.
- 2 Execute a program written in Python by means of a computer, generating a correct result.
- 3 Test and debug a program written in Python.
- 4 Make the right choices between different alternatives when writing a program in Python, taking into account performance (efficiency), coding style, and correctness.
- 5 Demonstrate a working knowledge about the basic principles of object-oriented programming.
- 6 Automate repetitive and complex tasks by means of UNIX-based tools.
- 7 Work interactively and non-interactively with operating systems, computer networks, file systems, and text editors.
- 8 Understand the structure of various text file formats, including HTML, XML, CSV, and FASTA.
- 9 Apply SQL to communicate with a relational database.
- 10 Independently resolve error messages through critical usage of technical documentation and online resources.

#### **Conditions for credit contract**

Access to this course unit via a credit contract is determined after successful competences assessment

#### **Conditions for exam contract**

This course unit cannot be taken via an exam contract

#### **Teaching methods**

Seminar, Lecture

#### **Study material**

Type: Handbook

Name: A Practical Guide to Linux: Commands, Editors, and Shell Programming  
Indicative price: € 40  
Optional: yes  
Language : English  
Author : Mark G. Sobell  
ISBN : 978-0-13477-460-2  
Oldest Usable Edition : Fourth Edition

Type: Handbook

Name: The Practice of Computing using Python  
Indicative price: € 90  
Optional: yes  
Language : English  
Author : William F. Punch and Richard Enbody  
ISBN : 978-0-13437-976-0  
Oldest Usable Edition : Third Edition

Type: Slides

Name: Informatics  
Indicative price: Free or paid by faculty  
Optional: no  
Language : English  
Number of Slides : 1356  
Available on Ufora : Yes  
Available through Student Association : No

Type: Software

Name: Dodona, Online Python Tutor, PyCharm, Linux shell  
Indicative price: Free or paid by faculty  
Optional: no  
Online Available : Yes

### **Course content-related study coaching**

The syntax and the semantics of the programming language Python, the database management language SQL, and selected UNIX tools are presented in the course slides and in the course handbooks, and need to be acquired largely through (guided) self-study.

Solutions for selected computer exercises are discussed during the theory lectures so that students learn how computational skills can be applied in practice.

During the weekly supervised hands-on sessions, students themselves learn how to tackle computational challenges by working on a series of mandatory computer exercises that need to be solved independently. These computer exercises aim at bringing the theory into practice.

Dodona, a digital learning environment, gives students instant feedback on their solutions submitted for the Python programming challenges, containing additional exercises for further practicing.

After each deadline, example solutions for all exercises are made available on Ufora.

Information about the calculation of the different evaluation marks is communicated during the theory lectures at the beginning and near the end of the first-term and the second-term teaching activities.

Example examinations of previous years are made available on Ufora near the end of the first-term and the second-term teaching activities.

Announcements on Ufora are used for counselling, giving feedback, and providing background information.

Through individual appointments scheduled via email, the lecturer and the teaching assistants are available for answering questions about the course in general (grading, examination), the theory, and the exercises.

### **Assessment moments**

end-of-term and continuous assessment

### **Examination methods in case of periodic assessment during the first examination period**

Skills test

### **Examination methods in case of periodic assessment during the second examination period**

Skills test

### **Examination methods in case of permanent assessment**

Skills test

### **Possibilities of retake in case of permanent assessment**

examination during the second examination period is not possible

### **Calculation of the examination mark**

For the **first-term examination period**, the mark of the periodic evaluation (end-of-term assessment) accounts for 80% of the partial examination mark for Term 1 and the mark of the non-periodic evaluation (hands-on sessions; continuous assessment) accounts for 20% of the partial examination mark for Term 1. To qualify for passing, both the mark of the periodic and the non-periodic evaluation should be at least equal to 8/20 (40%). If that is not the case, then the partial examination mark for Term 1, as obtained during the first-term examination period, is the least of the two obtained marks. No second partial examination opportunity is administered

during the first-term resit examination period.

If the partial examination mark for Term 1, as obtained during the first-term examination period, is higher than or equal to 10/20, then one partial examination is used during the second-term examination period, only covering the course content of Term 2, with this partial examination consisting of both a periodic and non-periodic evaluation.

If the partial examination mark for Term 1, as obtained during the first-term examination period, is lower than 10/20, then two partial examinations are used during the second-term examination period: a first partial examination covering the content of Term 1, only consisting of a periodic evaluation, and a second partial examination covering the content of Term 2, consisting of both a periodic and non-periodic evaluation.

Students who obtained a partial examination mark for Term 1 higher than or equal to 10/20 during the first-term examination period, may decide to retake the partial examination covering the content of Term 1 during the second-term examination period, with this partial examination only consisting of a periodic evaluation. When doing so, the mark obtained for the latter periodic evaluation is used for calculating the partial examination mark for Term 1 (that is, the mark obtained for the periodic evaluation that took place during the first-term examination period is discarded).

For **the second-term examination period**, the mark of the periodic evaluation accounts for 80% of the partial examination mark for Term 2 and the mark of the non-periodic evaluation accounts for 20% of the partial examination mark for Term 2. To qualify for passing, both the mark of the periodic and the non-periodic evaluation should be at least equal to 8/20 (40%). If that is not the case, then the partial examination mark for Term 2, as obtained during the second-term examination period, is the least of the two obtained marks.

During Term 2, the non-periodic evaluation for Term 1 cannot be retaken. Therefore, the partial examination mark for Term 1 during the second-term examination period is calculated twice. For the first calculation, the mark of the non-periodic evaluation, as obtained during Term 1, accounts for 20% of the partial examination mark and the mark of the periodic evaluation, as obtained for the Term 1 content during the second-term examination period, accounts for the remaining 80% of the partial examination mark. For the second calculation, the partial examination mark is equal to the mark of the periodic evaluation, as obtained for the Term 1 content during the second-term examination period (that is, the mark of the non-periodic evaluation, as obtained during Term 1, is not taken into account). The partial examination mark for Term 1 during the second-term examination period is then equal to the maximum of the above two calculations. Note that the mark of the periodic evaluation, as obtained for the Term 1 content during the second-term examination period, should be at least equal to 8/20 (40%). If that is not the case, then the partial examination mark for Term 1, as obtained during the second-term examination period, is the least of the two obtained marks.

The final examination mark is the average of the partial examination mark for Term 1 and the partial examination mark for Term 2. To qualify for passing (that is, to have a final examination mark that is higher than or equal to 10/20), both partial examination marks should be higher than or equal to 8/20 (40%). If that is not the case, then the final examination mark, as obtained during the second-term examination period, is the least of the two obtained marks.

During **the second-term resit examination period**, a third partial examination opportunity is organized that covers the Term 1 content, as well as a second partial examination opportunity that covers the Term 2 content, with both partial examination opportunities only consisting of a periodic evaluation. Given that the non-periodic evaluation for Term 1 and the non-periodic evaluation for Term 2 cannot be retaken during the second-term resit examination period, both the partial examination mark for Term 1 and the partial examination mark for Term 2 are calculated twice, following the approach and the conditions used for calculating the partial examination mark for Term 1 during the second-term examination period. Furthermore, following the conditions in place for the second-term examination period, the final examination mark is again the average of the partial examination mark for Term 1 and the partial examination mark for Term 2, with both partial examination marks again having to be higher than or equal to 8/20 (40%) in order to qualify for passing.

Marks for partial examinations can never be transferred to the second-term resit examination

period.

Students who eschew period aligned and/or non-period aligned evaluations for this course unit may be failed by the examiner.
