Lecturers in academic year 2025-2026

Braeckman, Ulrike WE11 lecturer-in-charge Vanaverbeke, Jan WE11 co-lecturer Vangestel, Carl WE11 co-lecturer

Offered in the following programmes in 2025-2026

6 International Master of Science in Marine Biological Resources Α

Teaching languages

English

Keywords

Position of the course

Numerical tools help to ask scientific questions more efficiently and extract appropriate answers. This course will introduce students to many basic techniques in data analysis and statistical modelling, to help them summarise a problem in mathematical terms, plan experiments or field sampling campaigns, and gather insights from the data collected.

Students will learn how to identify sources of variation in biological data and decide on sampling/experimental units and replicates. Major inferential statistical and data exploration techniques will be taught. A programming language (R) will be used to apply all those techniques.

Contents

The class will consist of theoretical parts and applications to actual data sets. The themes tackled are presented below. While the core of the programme will be the same in all universities, some classes are optional (in brackets: []) and the specific time spent on each part will vary between universities.

Maths and programming basics

Notion of variable and of assignation; data types; data import; data manipulation, repetition of operations.

*Numerical integration of differential equations; matrix computation

Data representation (visualisation)

Experimental/sampling design

Best practices in experiment and sampling design for optimal statistical power

Linear models

Revision of simple linear regression, revision of ANOVA (as a particular case of linear model)

Multiple regression and multi-factor ANOVA; model selection

[Introduction to generalised linear model: logistic regression, Poisson regression] Introduction to mixed effects models

> (Approved) 1

0.0h

offering

Non parametric tests

Notion of rank, basic non-parametric version of inferential tests (Wilcoxon-Mann-

Whitney, Kruskall-Wallis)

*notion of bootstrap and bootstrap tests

Introduction to multivariate data analysis

Principal Component Analysis

Correspondence Analysis or Multidimensional Scaling

- *Numerical modelling
- *OD dynamical box and flux models (Fasham-like NPZD model)
- *Population dynamics models (Leslie-like matrix models)
- * Not at UGent

Initial competences

Bachelor in sciences. Basic knowledge in sampling and experimental design (notion of replicate), descriptive statistics (distributions, statistical moments), and basic statistical inference (comparison of means, correlation, one-way ANOVA, simple linear regression).

Final competences

- 1 Understand and identify sources of variation in biological data.
- 2 Decide on sampling/experimental units and replicates based on natural history, literature and identification of sources of variation in biological data.
- 3 Using the identified research questions, formulate the applying best hypotheses to test.
- 4 Identify traps in experimental designs.
- 5 Use the programming language R.
- 6 Apply data exploration techniques.
- 7 Construct major inferential statistical models.
- 8 Present the statistical output graphically.
- 9 Interpret the results of the statistical tests.
- 10 Collaborate on data analysis and interpretation.

Conditions for credit contract

Access to this course unit via a credit contract is determined after successful competences assessment

Conditions for exam contract

This course unit cannot be taken via an exam contract

Assessment moments

end-of-term assessment

Examination methods in case of periodic assessment during the first examination period

Written assessment

Examination methods in case of periodic assessment during the second examination period

Written assessment

Examination methods in case of permanent assessment

Possibilities of retake in case of permanent assessment

not applicable

Extra information on the examination methods

UALG: 3 h final exam, open notes with broad interpretation questions UPMC: 3h written exam, no documents, exercises and interpretation questions UGent: Group asignment (integrated exercise in R) + 3h written exam with exercises and interpretation questions. No documents allowed. Uniovi: Assignment describing a complete sampling protocol/experimental design on a realistic scenario

Calculation of the examination mark

Final score is based on the group assignment (25%) and the written exam (75%). All students are expected to contribute to the group assignment (verified through peer-evaluation).

The written exam consists of questions from two lecturers dealing with different parts of the course.

Students can only pass when they pass both parts of the written exam (75%). If you do not show up at the designated time without a <u>legitimate reason</u>, you will be considered absent.
