

Analysis of High Temperature Processes in Extractive Metallurgy (I002884)

Due to Covid 19, the education and evaluation methods may vary from the information displayed in the schedules and course details. Any changes will be communicated on Ufora.

Course size *(nominal values; actual values may depend on programme)*
Credits 5.0 **Study time** 150 h **Contact hrs** 60.0 h

Course offerings in academic year 2021-2022

A (semester 1) English Gent

Lecturers in academic year 2021-2022

Charitos, Alexandros FREIBE01 lecturer-in-charge

Offered in the following programmes in 2021-2022

	crdts	offering
International Master of Science in Sustainable and Innovative Natural Resource Management	5	A

Teaching languages

English

Keywords

Position of the course

The goal of the module is to train the students in the analysis of high temperature processes from a process engineering perspective. After successful completion of the course, the students will be in a position to analyze aforementioned processes with regard to (i) thermodynamics (ii) fluid-dynamics (iii) link the above with unit operations and their mass and heat balances (iv) be able to conduct a short literature research and present results (v) understand troubleshooting methodology associated to these processes.

Contents

The lecture is divided to sub-modules: (i) Brief thermodynamics recap to aid understanding for the rest of the modules (ii) Gas-solid reaction processes: Roasting and calcination – a description of unit operations, Thermodynamics – Construction of Kellogg predominance diagrams, Discussion on fluidized bed fluid dynamics, Mass and heat balances (iii) Reduction processes: Analysis of ferroalloy production processes with focus on silicon/ ferrosilicon is included amongst other examples, Discussion on the Pidgeon process for the production of magnesium (iv) Oxidative smelting processes: The extractive metallurgy of copper / matte smelting fundamentals / bath and flash smelters (mass and heat balances) / P-S converters / fire refining – casting and brief description in electrorefining (v) Electrolysis in molten salt baths: Introduction to the Hall Heroult process for aluminium production (vi) Recycling processes: Introduction to Li-ion battery and electronic waste recycling processes.

Initial competences

Revision of courses associated to metallurgical thermodynamics

Final competences

Conditions for credit contract

This course unit cannot be taken via a credit contract

Conditions for exam contract

This course unit cannot be taken via an exam contract

Teaching methods

Lecture, integration seminar

Learning materials and price

Course content-related study coaching

Evaluation methods

Examination methods in case of periodic evaluation during the first examination period

Examination methods in case of periodic evaluation during the second examination period

Examination methods in case of permanent evaluation

Possibilities of retake in case of permanent evaluation

examination during the second examination period is possible in modified form

Calculation of the examination mark

The Grade is generated from the examination result(s) with the following weights (w):

AP*: Assignment [w: 1]

KA* [w: 3]

* In modules requiring more than one exam, this exam has to be passed or completed with at least "ausreichend" (4,0), respectively.
