Lecturers in academic year 2021-2022

- **Soetaert, Karline**
  - WE11 lecturer-in-charge

- **Bonte, Dries**
  - WE11 co-lecturer

Offered in the following programmes in 2021-2022

| Master of Science in Marine and Lacustrine Science and Management | 3 | A |

Teaching languages

- English

Contents

Present day environmental problems (e.g. eutrophication, contaminant dispersal, climate change, ocean acidification) require a quantitative approach. To better understand how natural systems respond to such changing inputs and boundary conditions, biogeochemical models of varying complexity are being called upon. The central aim of this course is to learn how to develop and apply such models. In this course we will focus particularly on elemental cycling (Carbon, Nitrogen etc) and transport of contaminants within aquatic ecosystems (e.g. rivers, estuaries, lakes, oceans). Models are implemented in the open-source programming language R.

- Models in the environmental sciences.
- What is a model?
- Types of models
- Model examples (e.g. North Sea, Scheidt estuary, ocean acidification)

Construction of models

- Balance equations, boundary conditions, transport formulation, kinetic rate laws
- Reactive transport models (box models, 1D, 2D and 3D)
- pH models, acid-base chemistry and CO2 uptake

Model solution

- steady-state solutions versus transient solutions
- analytical versus numerical solution
- numerical integration procedures

Model applications

- Causes of uncertainty in model predictions
- Sensitivity analysis
- Fitting models to data: parameter estimation, cost functions, estimators (least squares, maximum likelihood)
- Parameter uncertainty
- Model selection

(Approved)
Initial competences

Final competences

Conditions for credit contract
Access to this course unit via a credit contract is determined after successful competences assessment

Conditions for exam contract
This course unit cannot be taken via an exam contract

Teaching methods
Lecture, seminar: coached exercises

Learning materials and price
