Teaching languages

Dutch

Keywords

Quantum mechanics, modern physics, particle-wave duality, Schrödinger equation, quantum entanglement

Position of the course

This course unit belongs to the *learning pathway "General physics" in the Bachelor program Physics and Astronomy*. Quantum mechanics gets introduced at an introductory level. The course illustrates that a number of crucial experiments that were carried out in the early 1900s prompted thorough revisions of existing physical theories in order to provide a proper description of the physics of subatomic phenomena. We start from the concept of the wave function. The time-dependent and time-independent Schrödinger equation are thoroughly studied as evolution equations in quantum mechanics. After dealing with the general formalism, attention is paid to the study of one-dimensional quantum systems. One of the major goals of the course is to establish the importance of quantum mechanics for the description of many systems.

Contents

- Introduction to quantum mechanics (black-body radiation, particle properties of radiation, energy spectrum of atoms and molecules, photoelectric effect, Compton effect, Stern-Gerlach experiment, energy quantisation, directional quantisation, spin)
- Introduction to the microscopic structure of atoms and atomic nuclei. Quantum mechanics and the subatomic world.
- Properties of matter (Bohr's atomic model, de Broglie wave nature of matter, double-slit experiment)
- The concept of wave function as a probability amplitude (particle-wave duality, free particle, wave packets, momentum wave function and Fourier transformations, position-momentum uncertainty in quantum mechanics)
- The Schrödinger equation (connection with classical wave theory, time-dependent Schrödinger equation, continuity equation, current conservation, expectation value, Ehrenfest theorem, time-independent Schrödinger equation, energy quantisation, eigenvalue problems: energy spectrum and wave functions, superposition)

- One-dimensional systems (free particle, potential step, various potential well problems, quantum tunneling, harmonic oscillator)
- The formalism and axioms of quantum mechanics (Dirac bra-ket vectors, measurement process in quantum mechanics, representations in quantum mechanics, occupation number representation for the harmonic oscillator, dynamical variables and operators, matrix representation of quantum mechanics)

Initial competences

Prerequisites: basics of physics (mechanics, waves and optics, electricity and magnetism) and the basics of mathematics (linear algebra, functions, calculus, vector analysis).

Final competences

- 1 Possess the basic knowledge of quantum mechanics indispensable for studying subjects like condensed-matter physics, nuclear physics, atomic and molecular physics, elementary particle physics.
- 2 To possess the required background knowledge to study the important branches of theoretical physics like relativity, advanced quantum mechanics, statistical physics, and field theory.
- 3 The student has a sound knowledge of the mathematical aspects of quantum mechanics, including probability distributions, probability currents, second-order partial differential equations, Hilbert spaces, constrained eigenvalue problems.
- 4 Possess the skills and knowledge to compute the properties of one-dimensional quantum systems.

Conditions for credit contract

Access to this course unit via a credit contract is determined after successful competences assessment

Conditions for exam contract

This course unit cannot be taken via an exam contract

Teaching methods

Seminar, Lecture

Extra information on the teaching methods

Lectures present the theoretical concepts. Tutorials aim at providing a deeper insight into the concepts of the course. The tutorials train the students in problem solving.

Study material

Type: Handbook

Name: "Quantum Mechanics", B.H. Bransden & C.J. Joachain (Longman, Second Edition)
 Indicative price: € 46
 Optional: no
 Language : English
 ISBN : 978-0-58235-691-7
 Online Available : Yes
 Available in the Library : Yes
 Available through Student Association : Yes
 Usability and Lifetime within the Course Unit : intensive
 Usability and Lifetime after the Study Programme : regularly

Type: Slides

Name: Presentations that accompany the theory classes.
 Indicative price: Free or paid by faculty
 Optional: no
 Language : Dutch
 Available on Ufora : Yes

Type: Handouts

Name: Notes with exercises and model solutions that accompany the problem sessions
 Indicative price: Free or paid by faculty
 Optional: no
 Language : Dutch
 Available on Ufora : Yes

Type: Software

Name: Python Jupyter notebooks illustrating quantum mechanical principles

Indicative price: Free or paid by faculty

Optional: yes

Available on Athena : Yes

Course content-related study coaching

The possibility is provided for students to contact the lecturer(s) after the lecture hours. Appointments for small groups of students can be arranged in order to supply

Additional course information.

Assessment moments

end-of-term assessment

Examination methods in case of periodic assessment during the first examination period

Written assessment with open-ended questions

Examination methods in case of periodic assessment during the second examination period

Written assessment with open-ended questions

Examination methods in case of permanent assessment

Possibilities of retake in case of permanent assessment

not applicable

Extra information on the examination methods

- The written exam consists of two parts: an open-book part and a closed-book part. The open-book part has a number of problems that the student has to solve.

Calculation of the examination mark

- 40% for the open-book part of the written exam
- 60% for the closed-book part of the written exam
