

Quantitative Methods in Marine Science (C003872)

Course size *(nominal values; actual values may depend on programme)*

Credits 6.0 **Study time** 150 h **Contact hrs** 116.0 h

Course offerings and teaching methods in academic year 2022-2023

A (semester 1)	English	Gent	seminar	32.5 h
			seminar: practical PC room	35.0 h
			classes	
			lecture	23.75 h

Lecturers in academic year 2022-2023

Braeckman, Ulrike	WE11	lecturer-in-charge
Vanaverbeke, Jan	WE11	co-lecturer
Vangestel, Carl	WE11	co-lecturer

Offered in the following programmes in 2022-2023

International Master of Science in Marine Biological Resources	crdts	offering
	6	A

Teaching languages

English

Keywords

Position of the course

Numerical tools help to ask scientific questions more efficiently and extract appropriate answers. This course will introduce students to many basic techniques in data analysis and numerical modelling, to help them summarise a problem in mathematical terms, plan experiments or field sampling campaigns, and gather insights from the data collected. Students will learn how to identify sources of variation in biological data and decide on sampling/experimental units and replicates. Major inferential statistical and data exploration techniques will be taught. Numerical models will be introduced as a way to simplify and formalise a system. A programming language (R) will be used to apply all those techniques. Students will learn:

- how to use computer code to read and manipulate data, to implement statistical tests or dynamical models
- how to efficiently plan an experiment or field sampling campaign
- how to choose an appropriate data analysis technique
- how to interpret the output of basic inferential statistics
- how to represent data and model output graphically

Contents

The class will consist of theoretical parts and applications to actual data sets. The themes tackled are presented below. While the core of the programme will be the same in all universities, some classes are optional (in brackets: []) and the specific time spent on each part will vary between universities.

Maths and programming basics

notion of variable and of assignation; data types; data import; data manipulation, repetition of operations.

numerical integration of differential equations; matrix computation
 data representation (plotting)
 Experimental/sampling design
 best practices in experiment and sampling design for optimal statistical power
 Linear model
 revision of simple linear regression, revision of ANOVA (as a particular case of linear model)
 multiple regression and multi-factor ANOVA; model selection
 introduction to generalised linear model: logistic regression, Poisson regression
 [introduction to mixed effects models]
 Non parametric tests
 notion of rank, basic non-parametric version of inferential tests (Wilcoxon-Mann-Whitney, Kruskal-Wallis)
 [notion of bootstrap and bootstrap tests]
 Introduction to multivariate data analysis
 Principal Component Analysis
 [Correspondence Analysis or Multidimensional Scaling]
 Numerical modelling
 OD dynamical box and flux models (Fasham-like NPZD model)
 Population dynamics models (Leslie-like matrix models)

Initial competences

Bachelor in sciences. Basic knowledge in sampling and experimental design (notion of replicate), descriptive statistics (distributions, statistical moments), and basic statistical inference (comparison of means, correlation, one-way ANOVA, simple linear regression).

Final competences

How to translate a marine sciences question or hypothesis in mathematical terms and how to select the factors that are more relevant to answer it.

Conditions for credit contract

Access to this course unit via a credit contract is determined after successful competences assessment

Conditions for exam contract

This course unit cannot be taken via an exam contract

Teaching methods

Lecture, seminar, seminar: practical PC room classes

Course content-related study coaching

Evaluation methods

end-of-term assessment

Examination methods in case of periodic evaluation during the first examination period

Written examination, oral examination

Examination methods in case of periodic evaluation during the second examination period

Written examination, oral examination

Examination methods in case of permanent evaluation

Possibilities of retake in case of permanent evaluation

not applicable

Extra information on the examination methods

UALG: 3 h final exam, open notes with broad interpretation questions

UPMC: 3h written exam, no documents, exercises and interpretation questions

UGent: 3h written exam + oral feedback

Uniovi: Assignment describing a complete sampling protocol/experimental design on a realistic scenario

Calculation of the examination mark
