**offering**

A

**Teaching languages**

English

**Keywords**

molluscs, crustaceans, fish, disease, pathogens, tumors, pollution, health assessment

**Position of the course**

Topics covered will include the description of the normal and pathological; histology of marine invertebrates and fish, with special emphasis on the effects of chemical pollutants and other sources of environmental stress.

Aims at describing the normal and pathological histology of marine animal species: mainly fishes, molluscs and crustaceans; identifying histopathological alterations of viral, bacterial, parasitic and toxic (due to pollutant exposure) ethiology; and characterising the cellular and molecular mechanisms involved in pathological damage and organismal defence.

At the end of the Unit, the student should be able to conduct histological processing of marine animal tissues, identify normal tissues and cell types at the light microscope in marine molluscs and fish; identify major parasites and histopathological lesions in marine molluscs and fish; and search in the web and literature the relevant information concerning molluscs and fish disease, with emphasis in environmentally relevant syndromes.

**Contents**

- 1 Lectures: Comparative histology of marine invertebrates. Normal histology of molluscs. Normal histology of fishes. Basic principles in biopathology, histopathology and parasitology. Molluscs: general histopathology, toxicopathology, neoplastic lesions, natural variability and temporal trends in histopathological lesions. Fish: general histopathology, mechanisms of chemical carcinogenesis, carcinogenic lesions. Histopathology in ecosystem health assessment: quantitative histopathology, quality assurance, monitoring programmes.
- 2 Practicals: Histotechnology preparation of samples. Microscopical examination of molluscan tissues. Microscopical examination of fish tissues. Histopathological examination of marine molluscs. Histopathological examination in fishes. Navigating through the web in search of data bases and images of aquatic animal histopathology.
- 3 Workshop on toxicological pathology (mini-symposium).

**Initial competences**

Basis of bioscience or animal science and environmental sciences.

## **Final competences**

- 1 Be familiar with the form and function of organs and tissues in aquatic animals (comparative histology).
- 2 Understand the normal histological organisation of target tissues in molluscs (integument, kidney, blood, digestive gland).
- 3 Understand the normal histological organisation of target tissues in marine fishes (integument, kidney, spleen, blood, liver).
- 4 Recognise major parasites and pathological lesions in molluscs and fish.
- 5 Know the value of histopathology in ecosystem health monitoring and marine pollution assessment.

## **Conditions for credit contract**

Access to this course unit via a credit contract is determined after successful competences assessment

## **Conditions for exam contract**

This course unit cannot be taken via an exam contract

## **Teaching methods**

Seminar, Lecture, Seminar: practical pc room classes

## **Extra information on the teaching methods**

Lectures 20  
Practicals 18  
Computer class 2

## **Learning materials and price**

## **Course content-related study coaching**

## **Assessment moments**

end-of-term assessment

## **Examination methods in case of periodic assessment during the first examination period**

Skills test, Report

## **Examination methods in case of periodic assessment during the second examination period**

Skills test, Report

## **Examination methods in case of permanent assessment**

## **Possibilities of retake in case of permanent assessment**

not applicable

## **Calculation of the examination mark**

- practical assessment (30%)
- report (70%)
