

Integrated Offshore Exploration (C003998)

Course size (nominal values; actual values may depend on programme)

Credits 6.0 **Study time 150 h**

Course offerings and teaching methods in academic year 2023-2024

A (semester 2)	English	Gent	lecture seminar
----------------	---------	------	--------------------

Lecturers in academic year 2023-2024

Van Rooij, David	WE13	lecturer-in-charge
Vandorpe, Thomas	WE13	co-lecturer

Offered in the following programmes in 2023-2024

	crdts	offering
Master of Science in Geology	6	A
Master of Science in Marine and Lacustrine Science and Management	6	A
Exchange programme in Geology (master's level)	6	A

Teaching languages

English

Keywords

Drilling and coring techniques, site survey, geophysical borehole logging, seismic profiling, multibeam bathymetry, sidescan sonar, visual seabed mapping

Position of the course

The sampling of sedimentary archives through drilling is a common technique for academic and economical goals, both onshore as offshore. The selection of the target site is taking in account many prerequisites, among which a thorough risk analysis. Therefore, a detailed site survey needs to be carried out. This course will zoom in on all aspects of such a site survey as well as the execution of the drilling, with special attention to the geophysical characterisation of the seafloor and the (shallow) subsurface. The objectives of this course contribute to the skill of unravelling the multidisciplinary and integrated exploration strategies of shallow shelf seas down to continental slopes.

Since this is a practical course, there is a limit to the number of participating students (12 max) due to logistical reasons. Students who have this course as obligatory unit in their major, or students of the Master of Science in Geology, Major Basins & Orogens, will get priority.

Contents

1 *Introduction: fundamental scientific and industrial objectives of seafloor research, as well as legal, ethical, logistical and budgetary aspects. Importance of a correct site survey prior to invasive drilling: risk assessment. Aspects of (subsea) navigation.*

2 *Visual & oceanographic observation techniques: ROV, ADCP, CTD*

3 *Basic principles and techniques regarding geophysical seafloor mapping: multibeam bathymetry & backscatter, sidescan sonar, AUV.*

4 *Visual & oceanographic observation techniques: ROV, ADCP, CTD*

5 *Seismic profiling: single- vs. multichannel seismics. Advanced processing & interpretation*

6 *3D-4D seismics: acquisition, processing and interpretation (attributes)*

7 *Sampling techniques: long cores, vibrocoring, drilling*

8 *Geophysical characterisation of cores and boreholes*

9 *Integration of drilling and seismics: practical aspects*

Initial competences

Bachelor geology and has followed the course of exploration geophysics

Final competences

- 1 The student has acquired qualities in the drafting of a multidisciplinary offshore exploration strategy.
- 2 The student is aware of potential technical and environmental risks and can make a risk assessment for a drilling campaign.
- 3 The student possesses an overview of the most common marine surveying techniques and knows the basic skills for acquisition.
- 4 The student possesses the basic skills to process a geophysical dataset and to provide a first interpretation.
- 5 The student can integrate geophysical drilling data into a geophysical seabed survey project.
- 6 The student is familiar with the technical vocabulary and can report and present the technical results of a survey in a linguistically correct manner.

Conditions for credit contract

Access to this course unit via a credit contract is determined after successful competences assessment

Conditions for exam contract

This course unit cannot be taken via an exam contract

Teaching methods

Seminar, Lecture, Practical, Independent work

Extra information on the teaching methods

- The research activities are interactive in which the active contact between student and lecturer or instructor is central.
- During the fieldwork on board of a hydrographic vessel (VLIZ or Flemish Hydrography) or RHIB Zeekat (VLIZ), shallow geophysical data will be acquired. This also includes a visit to the "Marine Robotics Centre" of the VLIZ in Ostend. The fieldwork will be scheduled ad hoc during the Easter Holidays.
- The PC-class exercises endeavor to learn the students a set of basic software skills in order to process and present the acquired data. This will be performed using both academic, industrial and self-acquired datasets.
- The independent work includes a critical interpretation, evaluation and presentation of a technical and scientific dataset of an IODP (or other) drilling project and site survey. This will be concluded in writing a paper and a presentation. The evaluation process will use peer-review among the students.

Learning materials and price

Collection of powerpoint slides and a selection of scientific papers and relevant study material. This material is made available as PDF through the UGent Ufora system.

Course content-related study coaching

The study counselling will be directly performed by the lecturers, assisted by post-docs, PhD students and teaching assistants.

Assessment moments

end-of-term and continuous assessment

Examination methods in case of periodic assessment during the first examination period

Oral assessment, Assignment

Examination methods in case of periodic assessment during the second examination period

Oral assessment, Assignment

Examination methods in case of permanent assessment

Skills test, Participation, Presentation, Peer and/or self assessment, Assignment

Possibilities of retake in case of permanent assessment

examination during the second examination period is possible in modified form

Extra information on the examination methods

- Non-Periodical Evaluation project: oral presentation and discussion of the project with fellow students
- Non-Periodical Evaluation participation: active participation to the PC-class exercises. Knowledge of the theoretical basic elements during the field work.
- Non-Periodical Evaluation skills test: processing of a geophysical dataset (and first interpretation)
- Periodical Evaluation: the oral examination will interrogate the student about the written part of the project (paper), regarding the content as the aspects of the theory that have been addressed

Calculation of the examination mark

- NPE: active presentation of a project proposal with discussion and (self-)evaluation by lecturer and students (20%), participation (20%), skills test (20%).
- PE: oral exam about the project (20% project, 20% oral)

Unlawful absence during the practical exercises and fieldwork will lead to a total score (theory & practicals) of maximum 7/20, regardless the scores of the theory.

In case of non-participation to the evaluation of one or more parts, one cannot pass for the course. The final score, when higher than 7/20, will be reduced to 7/20.
