

## Complexity and Criticality (C004106)

**Course size** (nominal values; actual values may depend on programme)

**Credits 6.0**

**Study time 180 h**

**Contact hrs**

52.5h

### Course offerings and teaching methods in academic year 2022-2023

|                |         |      |                            |       |
|----------------|---------|------|----------------------------|-------|
| A (semester 2) | English | Gent | online lecture             | 0.0h  |
|                |         |      | lecture                    | 30.0h |
|                |         |      | guided self-study          | 7.5h  |
|                |         |      | seminar: coached exercises | 15.0h |
| B (semester 2) | Dutch   | Gent | seminar: coached exercises | 7.5h  |
|                |         |      | guided self-study          | 30.0h |
|                |         |      | online lecture             | 0.0h  |
|                |         |      | seminar                    | 15.0h |

### Lecturers in academic year 2022-2023

Ryckebusch, Jan

WE05

lecturer-in-charge

### Offered in the following programmes in 2022-2023

|   | crdts | offering |
|---|-------|----------|
| Master of Science in Teaching in Science and Technology(main subject Physics and Astronomy) | 6     | A        |
| Master of Science in Engineering Physics  | 6     | B        |
| Master of Science in Engineering Physics  | 6     | A        |
| Master of Science in Physics and Astronomy  | 6     | A        |
| Exchange Programme in Physics and Astronomy (Master's Level)                                | 6     | A        |

### Teaching languages

English, Dutch

### Keywords

Complexity, criticality, emergence, universality, algorithms, high-level features of complex systems

### Position of the course

This course aims at providing an advanced treatment of the numerical and analytical methods that can be used to extract the high-level features of complex systems consisting of many interacting units. Central issues are the concepts of complexity, emergence, coarse graining, criticality, metastability and phases. It is shown how these concepts can be used to reach a deeper level of understanding of materials, of biological systems and of socio-economic systems. The approximation methods for complex systems that are introduced include numerical algorithms, perturbation theory, mean-field theory and the real-space renormalization group.

### Contents

The course is centered around five topics:

(i) **Ising model** (phases, review of equilibrium statistical mechanics, magnetization, response functions, spin-spin correlation function, critical temperature, mean-field and perturbation theory of the Ising model, Landau theory of continuous phase transitions, Widom scaling ansatz, universal critical exponents, order parameters, Ginzburg criterion, real-space renormalization theory, order-disorder transitions in alloys, fluctuation-dissipation theorem, Wang-Landau sampling, Markov chain Monte Carlo simulation methods, the connection

*between magnets and fluids, nucleation)*

(ii) **Percolation model** (*definition, cluster number density, average cluster size, selfsimilarity, fractal dimension, correlation length, order parameter, real-space renormalization, fixed points, coarse graining, algorithms to identify clusters in networks, statistical methods designed to deal with phenomena that extend over many scales*)

(iii) **Self-organised criticality and non-equilibrium systems** (*dynamic equilibrium, sandpile metaphor, Bak-Tang-Wiesenfeld model, mean-field theory of the BTW Model, examples of scale-free behaviour in nature, alternate dynamics that describes scale-free behaviour in nature*)

(iv) **Dense gases and liquids** (*Van-der Waals theory, perturbation theory, effective interactions, cumulant expansions, virial expansions, distribution and correlation functions, cluster diagrams, fluctuation-dissipation theorem, velocity-autocorrelation functions*)

(v) **Econophysics** (*crashes as critical phenomena, random walks in finance and physics, physics-inspired methods for time-series analysis, multiscale problems in the analysis of time series, early-warning indicators, discrete scale invariance and log-periodic power laws*)

### Initial competences

Basic course in Statistical Physics ; Basic course in programming for Engineers & Scientists (Python or comparable computer language)

### Final competences

- 1 To grasp the fundamental statistical theories underlying the dynamics of complex systems consisting of many interacting units.
- 2 To gain familiarity with advanced simulation techniques based on modern physical theories.
- 3 To develop the skills to apply these simulation techniques within a variety of engineering disciplines.
- 4 To gain familiarity with the present quantitative understanding of how complex systems respond to external changes.
- 5 To gain a fundamental understanding of phases and phase transitions (sudden changes) in complex systems.

### Conditions for credit contract

Access to this course unit via a credit contract is determined after successful competences assessment

### Conditions for exam contract

This course unit cannot be taken via an exam contract

### Teaching methods

Online lecture, Guided self-study, Seminar, Lecture, Seminar: coached exercises

### Learning materials and price

All learning materials are provided free of charge on the university's electronic learning system.

### Course content-related study coaching

The instructor(s) can be contacted after the lectures, or by appointment. Interactive support via Ufora. The lecturer offers the possibility to discuss the course material with individual or small groups of students. The university's

(Approved)

electronic learning environment is employed to discuss the course material with the students and to draw their attention to current research advances in complexity science.

**Assessment moments**

end-of-term assessment

**Examination methods in case of periodic assessment during the first examination period**

Oral examination, Open book examination

**Examination methods in case of periodic assessment during the second examination period**

Oral examination, Open book examination

**Examination methods in case of permanent assessment****Possibilities of retake in case of permanent assessment**

not applicable

**Extra information on the examination methods**

The theory part of the course is evaluated during the oral exam. The written exam consists of problems.

**Calculation of the examination mark**

- open-book written exam counts for 40% of the total mark
- oral exam counts for 60% of the total mark
