Keywords

dynamical systems, Euler integration, equilibria, bifurcation diagrams, tipping points, non-linear dynamics and chaos, oscillations, limit cycles, neurological model, Python

Position of the course

This course unit belongs to the learning pathway 'Interdisciplinarity & Broadening' in the Bachelor program Physics and Astronomy.

The aim of this course is to learn to model and analyze biological systems. For this we will base ourselves on the book "Modeling of life" by Alan Garfinkel, Jane Shevtsov and Yiba Guo.

Positive and negative feedback are a crucial part of learning to set up the model. For example, we will learn to model an ecosystem of prey (such as tuna) and predators (such as sharks), a typical negative feedback system. Most of the systems we will set up will be non-linear and cannot be solved with pen and paper. Therefore, these must be simulated with the computer to understand the behavior of the system. We will analyse these systems by learning to write scripts in Python.

Please have a look at our site for more info <https://biophysics.ugent.be/course>

Contents

- Learning to understand feedback: what is positive and what is negative feedback.
- Converting a system into a dynamical system: learning to convert words into mathematics.
- In this course we will model the following systems: population models, feather and friction systems, prey hunter systems, chemical reactions, epidemiology (such as learning to model the Corona virus), neurons, pest outbreak, respiration, food chains, and many others.
- Calculate trajectories of the evolution of the state of a system, via Euler integration.
- Recognize types of equilibria: stable knots, unstable knots, saddle points, stable and unstable coils.
- Method of the nullclines.
- Recognize bifurcations of equilibria: transcritical bifurcation, saddle-node bifurcation, pitch fork bifurcation. Special attention will go to tipping point in

climate systems

- Recognizing oscillations in systems: in chemistry, biology and physiology.
- Hopf bifurcation: the creation of limit cycles.
- Chaos: in continuous models and in discrete models. Learning to recognize the properties of chaos, understanding the routes to a chaotic system.

Initial competences

Basic knowledge of: linear algebra, mathematical analysis, differential equations

Final competences

- 1 To be able to convert a biological system of words to a differential equation.
- 2 To be able to compute the equilibria in a dynamical system.
- 3 To be able to compute the trajectory of a system via Euler's method.
- 4 To be able to analyse the types of bifurcations in a system.
- 5 To be able to analyse oscillations and limit cycles in a system.
- 6 To be able to recognize and analyse chaos in a continuous system as well as in a discrete system.
- 7 To be able to build and analyse a neurological model.
- 8 To be able to write scripts in Python to analyse a system.

Conditions for credit contract

Access to this course unit via a credit contract is determined after successful competences assessment

Conditions for exam contract

This course unit cannot be taken via an exam contract

Teaching methods

Group work, Seminar, Lecture

Extra information on the teaching methods

The lessons will alternate between theory and exercises and are divided into 12 parts. The lectures can be made available online upon request, but additional details are always provided during the lessons. The exercises are completed by students during the lessons on the computer using Python Notebooks. Each week, students receive new assignments. Students will also need to complete 2 graded assignments (5 points each). At the end of the semester, the students will receive the final assignment (10 points). During the exam, each student must orally defend their work and will be asked follow-up questions.

Each student will receive individual guidance/feedback throughout the year to improve their skills. The students will learn problem-solving thinking and writing clear code.

Study material

Type: Slides

Name: Introductory Biophysics

Indicative price: Free or paid by faculty

Optional: no

Language : English

Available on Ufora : Yes

Online Available : No

Available in the Library : No

Available through Student Association : No

Course content-related study coaching

Students can always contact the teacher and the assisting staff with questions about the course (theory and exercises).

Assessment moments

end-of-term and continuous assessment

Examination methods in case of periodic assessment during the first examination period

Oral assessment, Assignment

Examination methods in case of periodic assessment during the second examination period

Oral assessment, Assignment

Examination methods in case of permanent assessment

Assignment

Possibilities of retake in case of permanent assessment

examination during the second examination period is possible in modified form

Extra information on the examination methods

1. Individual work during the year

Two times during the semester the students will have to hand in an assignment, which can yield a total of 10 points. The teacher retains ultimate responsibility for deviating from the exact moments of evaluation.

2. Individual work with oral defense during the exam period

This work is on the remaining 10/20 points. The students have to give an oral explanation of the work, and additional questions will be asked to check whether the student has mastered the theory.

Each work is checked for plagiarism. The students have to come up with their own solution.

Calculation of the examination mark

- Individual work during the year: 10/20
- Work submitted on the exam with oral defense: 10/20
- Distribution key: Physics correct: 50%, correct code: 25%, correct figures 25%

Facilities for Working Students

To be discussed with the professor. De professor is open to allow changes for work students
