Teaching languages

English

Keywords

artificial intelligence, machine learning, neural networks

Position of the course

In recent years, the presence of AI in our daily lives has steadily increased. Its impact is much larger than many people realize. Especially since the launch of ChatGPT, AI is often mentioned in media reports.

In 2012, a neural network crashed all records in the ImageNet challenge, an international competition for computer algorithms that recognise objects in images.

This milestone relaunched the field of neural networks, a subfield of AI. Since then, neural networks have become the driving force behind many breakthroughs.

This course creates a frame of reference that will allow students to understand the evolutions in AI and to critically interpret reports about AI breakthroughs in the media. The most important technical principles are explained in an intuitive way, using examples and demonstrations. Throughout the course, there will be a strong focus on critical analysis and reflection. It is explicitly not the aim of this course to educate students to develop their own AI applications.

Contents

- Introduction: terminology, types of AI, history, applications
- Principles of machine learning
- The importance of data
- Neural networks
- AI for computer vision
- Language models and generative AI
- Ethical implications of AI
- Regulations related to AI
- Recent topics: impact of AI on humankind and society

Initial competences

For this course, no specific knowledge with respect to programming or mathematics is required. The course is taught in English. This means students need to be able to read articles in English from media sources or (non-technical parts of) scientific papers, to critically reflect on them and communicate or report on them in English.

Final competences

- 1 Understanding the distinction between AI, machine learning, and neural networks.
- 2 Being able to explain the role of data and understanding the consequences of the properties of this data.
- 3 Interpreting the role of algorithms and optimization criteria and comprehending the implications of certain choices made in this regard.
- 4 When given an application, being able to assess what to consider when collecting and using data to train AI models.
- 5 Adopting a critical-scientific attitude towards AI.
- 6 Interpreting news and information about AI, asking critical questions, and identifying where this information may be incomplete or possibly incorrect.
- 7 Being aware of the complexity of AI applications and their implications for ethical issues and the establishment and enforcement of regulations.
- 8 Reflecting from multiple perspectives on the applications of contemporary developments in AI and their consequences for individuals and society.

Conditions for credit contract

Access to this course unit via a credit contract is determined after successful competences assessment

Conditions for exam contract

This course unit cannot be taken via an exam contract

Teaching methods

Seminar, Lecture, Independent work

Extra information on the teaching methods

In the weekly lectures, knowledge transfer (lecturing) and interactive practice

(seminar) are combined. Students are expected to take notes during these activities (class discussions). Except for the statements, questions or sources that are discussed, there will be no other learning materials for these parts. In particular, there will be no lecture recordings. Attendance and active participation in these lectures is therefore strongly advised. A small amount of grades can be earned by participating in in-class activities (e.g. polls, in-class quizzes).

Multiple contact sessions will be preceded or followed by an individual assignment which is part of the evaluation.

Every week, a different subject is treated. In the first half of the semester we build up the basic knowledge. In the second half of the semester, we focus on recent applications and the consequences of recent developments in AI for humankind and for society. For some of these topics, guest speakers can be invited to elaborate on specific aspects such as ethics or regulations and to debate with the students about this.

Study material

Type: Slides

Name: Lecture slides

Indicative price: Free or paid by faculty

Optional: no

Language : English

Available on Ufora : Yes

Type: Reader

Name: Selected accessible scientific papers that provide background information

Indicative price: Free or paid by faculty

Optional: no

Language : English

Available on Ufora : Yes

Type: Other

Name: Lecture notes made by student during lectures

Indicative price: Free or paid by faculty

Optional: yes

Additional information: It is strongly advised to take notes during the lectures, especially during interactive activities and in-class discussions

References

Multiple sources that are available online will be mentioned in class (and on the lecture slides). Accessible scientific publications that are part of the learning material for this course will be made available through Ufora.

Course content-related study coaching

The teacher will be available for questions during and after class. For all other interaction about the contents of the course, MsTeams will be used.

Assessment moments

end-of-term and continuous assessment

Examination methods in case of periodic assessment during the first examination period

Written assessment with multiple-choice questions, Written assessment with open-ended questions

Examination methods in case of periodic assessment during the second examination period

Written assessment with multiple-choice questions, Written assessment with open-ended questions

Examination methods in case of permanent assessment

Written assessment with multiple-choice questions, Participation, Written assessment

Possibilities of retake in case of permanent assessment

examination during the second examination period is not possible

Extra information on the examination methods

Permanent evaluation consists of a number of assignments in which you apply the knowledge seen in class and/or prepare for the next lecture and (for a small part) of attendance and active participation in class.

The exam (periodic evaluation) will evaluate knowledge and understanding through direct questions, but also your ability to apply this. This competence is acquired

and practiced through active participation during lectures.

Calculation of the examination mark

Permanent evaluation 25% - Periodic evaluation (exam) 75%

The grade for permanent evaluation is calculated from participation scores and assignment scores.

Students who obtain a total score below 8/20 for the exam cannot pass the course in the first exam session. Their course grade will be no higher than 8/20.

There is no second chance for the permanent evaluation: the grade obtained during the semester is kept and again counts for 25% of the final grade.

Facilities for Working Students

Students are strongly advised to take notes, as active practice is part of the lectures and prepares you for the exam. It is therefore not advised to take up this course if you cannot regularly attend the lectures.
