

Aquaculture Genetics (1002795)

Course size *(nominal values; actual values may depend on programme)*

Credits 6.0

Study time 180 h

Course offerings in academic year 2024-2025

Lecturers in academic year 2024-2025

Offered in the following programmes in 2024-2025

crdts

offering

Teaching languages

English

Keywords

Molecular genetic techniques for detecting polymorphisms, qualitative and quantitative genetics, breeding programmes, chromosome manipulation, sex manipulation, polyploidisation, genetic maps.

Position of the course

This course starts with the study of the essential knowledge on genetic principles and molecular genetic techniques.

In the second part attention is paid to specific methods and implications of genetic research in aquaculture.

Contents

Theory

1. Fundamental knowledge on DNA structure
2. Molecular techniques for detecting genetic variation
3. Qualitative genetics
4. Quantitative genetics
5. F-statistics
6. Inbreeding
7. Use of androgenesis, gynogenesis and triploidisation
8. Manipulation of sexual phenotype
9. Breeding programmes
- 10 Genetic maps

Practical exercises

1. Handling and analysing genetic data
2. Application of molecular tools in analysis of broodstock population (paper group exercise)
3. Exercise on heritability
4. Lab exercise RFLP analysis of a mitochondrial DNA fragment

Initial competences

General biology, chemistry, biochemistry and basic knowledge on aquaculture.

Final competences

- 1 The student has insight into Mendelian genetics.
- 2 The student has knowledge on molecular markers and their application.
- 3 The student has basic knowledge on quantitative genetic models and parameters (heritability and genetic relations).
- 4 The student has insight into breeding value estimation in aquaculture (including sex

reversal).

5 The student understands the importance of selection, inbreeding and cross breeding in breeding programs.

6 The student has insight into the construction and the use of genetic maps.

7 The student is able to amplify and analyse (RFLP) a DNA fragment.

Conditions for credit contract

Access to this course unit via a credit contract is determined after successful competences assessment

Conditions for exam contract

This course unit cannot be taken via an exam contract

Teaching methods

Seminar, Lecture, Practical, Independent work

Extra information on the teaching methods

Theory lectures: lectures based on powerpoint presentations.

Practical classes: RFLP experiment in small groups.

Exercises: guided exercises and calculations and group work on cloning strategies.

Study material

None

References

An introduction to genetic analysis (Griffits et al.)

Principles of population genetics (Hartl & Clark)

Course content-related study coaching

Study guidance upon request by email or on appointment.

Assessment moments

end-of-term and continuous assessment

Examination methods in case of periodic assessment during the first examination period

Written assessment

Examination methods in case of periodic assessment during the second examination period

Written assessment

Examination methods in case of permanent assessment

Participation, Assignment

Possibilities of retake in case of permanent assessment

examination during the second examination period is possible

Extra information on the examination methods

Period aligned evaluation: theory: written closed book exam.

Non-period aligned evaluation: practical classes and exercise assessment: participation and report.

Calculation of the examination mark

Out of 20:

13 points attributed to written exam

2 points groupwork exercises

5 points attributed to report practical classes

Students that do not attend the practical classes without a valid reason, should retake the course the next academic year.

Students who eschew period aligned and/or non-period aligned evaluations for this course unit may be failed by the examiner.
